

# Recurrent Neural Networks (RNNs)

Lorena Gallego Viñarás  
([logalleg@pa.uc3m.es](mailto:logalleg@pa.uc3m.es))

# What are RNNs?

- Designed to **process sequential data** by maintaining a **memory of previous inputs**.
- RNNs **capture temporal dependencies** — the output at time  $t$  depends on previous steps.
- They use a **hidden state** passed across time steps, enabling the network to “remember” past context.
- RNNs **share weights** across all time steps.
- Trained via **Backpropagation Through Time (BPTT)**

Feedforward Neural Networks

Recurrent Neural Networks

Rolled RNN

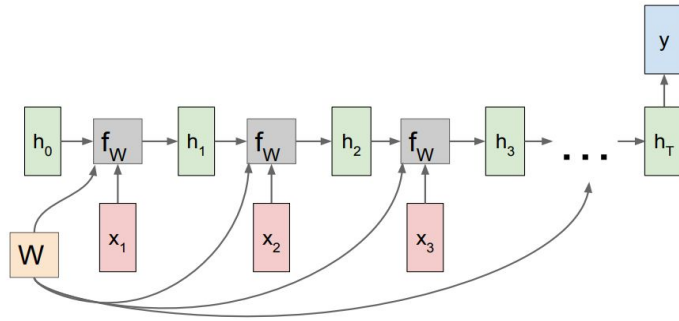

# Unrolled RNNs

- Horizontal Axis (Time –  $t$ ):**  
 Each column corresponds to a single time step ( $x_1, x_2, \dots, x_n$ )
- Vertical Axis (Depth – Layers):**  
 Each row represents a different RNN layer. Inputs are processed layer by layer, from bottom to top.
- States:**
  - $h_t^{(l)}$ : Hidden state at time  $t$ , layer  $l$
  - $c_t^{(l)}$ : Cell state at time  $t$ , layer  $l$  (only in LSTM)
- RNN has two outputs - out and hidden.

# Types of RNNs

RNN: Computational Graph: Many to One

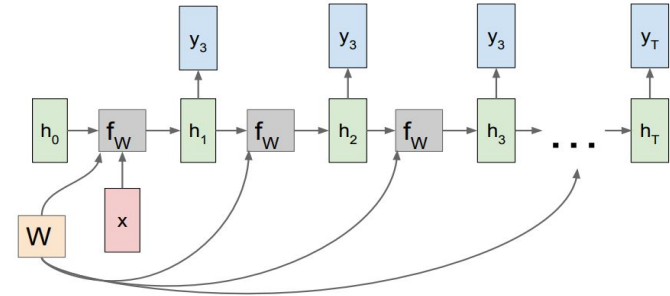

$$h_t = f_W(h_{t-1}, x_t)$$

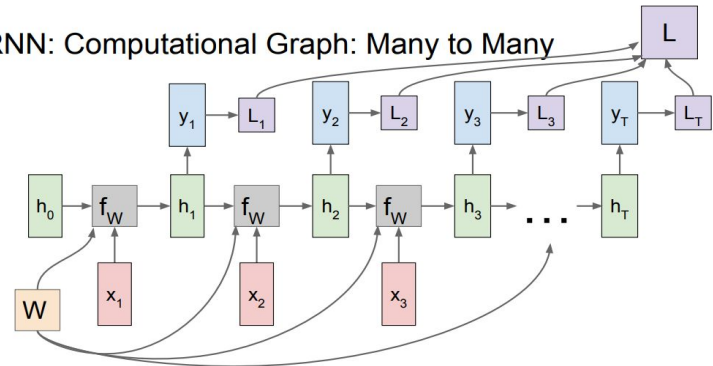

$$h_t = \tanh(W_{hh}h_{t-1} + W_{hx}x_t + B_h)$$

$$y_t = W_{hy}h_t + B_y$$

RNN: Computational Graph: One to Many

RNN: Computational Graph: Many to Many

# Applications of RNNs

Language Modeling  
& Translation

Sentiment Analysis

Speech Recognition  
& Synthesis

Time-Series  
Forecasting

Music Generation

Systems

Dialogue Systems &  
Storytelling

# Problems of traditional RNNs

- ✗ Vanishing gradients
- ✗ Exploding gradients
- ✗ Long-term memory fade
- ✗ Limited global context
- ✗ Low parallelism

## Solutions?

**Reduce** network **depth** to lower complexity.

Techniques such as **gradient clipping**, **learning rate scheduling**, and careful **regularization**

Use advanced architectures like **LSTM** or **GRU**.

# LSTM (Long Short-Term Memory)

Standard RNN

LSTM

# LSTM (Long Short-Term Memory)

Forget gate

$$f_t = \sigma (W_f \cdot [h_{t-1}, x_t] + b_f)$$

Decides **what** information to **discard**.

# LSTM (Long Short-Term Memory)

Input gate

$$i_t = \sigma (W_i \cdot [h_{t-1}, x_t] + b_i)$$

$$\tilde{C}_t = \tanh(W_C \cdot [h_{t-1}, x_t] + b_C)$$

Determines **what** information to **store**.

# LSTM (Long Short-Term Memory)

Input gate

$$C_t = f_t * C_{t-1} + i_t * \tilde{C}_t$$

Determines **what** information to **store**.

# LSTM (Long Short-Term Memory)

Output gate

$$o_t = \sigma (W_o [h_{t-1}, x_t] + b_o)$$

$$h_t = o_t * \tanh (C_t)$$

Controls **what** information is sent to the next layer

# GRU (Gated Recurrent Unit)

$$z_t = \sigma(W_z \cdot [h_{t-1}, x_t])$$

$$r_t = \sigma(W_r \cdot [h_{t-1}, x_t])$$

$$\tilde{h}_t = \tanh(W \cdot [r_t * h_{t-1}, x_t])$$

$$h_t = (1 - z_t) * h_{t-1} + z_t * \tilde{h}_t$$

- **Reset gate:** decides **how much** of the information from the past **should be kept** for future steps
- **Update gate:** determines **how much** past information **should be forgotten**.

# Comparative table

Aspect	RNN	LSTM	GRU
<b>Architecture</b>	<ul style="list-style-type: none"> <li>- Simple recurrent structure</li> <li>- Vanishing gradient issue</li> </ul>	<ul style="list-style-type: none"> <li>- Memory cells</li> <li>- Input, forget, output gates</li> </ul>	<ul style="list-style-type: none"> <li>- Fewer gates</li> <li>- Simpler than LSTM</li> </ul>
<b>Learning Capability</b>	<ul style="list-style-type: none"> <li>- Short-term dependencies only</li> </ul>	<ul style="list-style-type: none"> <li>- Good for long-term dependencies</li> </ul>	<ul style="list-style-type: none"> <li>- Handles both short &amp; long dependencies</li> </ul>
<b>Training Complexity</b>	<ul style="list-style-type: none"> <li>- Easy to implement</li> <li>- Unstable gradients</li> </ul>	<ul style="list-style-type: none"> <li>- Complex</li> <li>- Slow to train</li> </ul>	<ul style="list-style-type: none"> <li>- Simpler than LSTM</li> <li>- Faster training</li> </ul>
<b>Typical Applications</b>	<ul style="list-style-type: none"> <li>- Basic sequence modeling</li> <li>- Stock prediction</li> </ul>	<ul style="list-style-type: none"> <li>- Language modeling</li> <li>- Translation</li> </ul>	<ul style="list-style-type: none"> <li>- Speech &amp; video processing</li> </ul>
<b>Advantages</b>	<ul style="list-style-type: none"> <li>- Easy to understand</li> </ul>	<ul style="list-style-type: none"> <li>- Effective for long sequences</li> </ul>	<ul style="list-style-type: none"> <li>- Lightweight</li> <li>- Comparable to LSTM</li> </ul>
<b>Challenges</b>	<ul style="list-style-type: none"> <li>- Vanishing gradient</li> <li>- Poor long-term memory</li> </ul>	<ul style="list-style-type: none"> <li>- Slow training</li> <li>- Many parameters</li> </ul>	<ul style="list-style-type: none"> <li>- Sometimes slightly less accurate</li> </ul>

# PyTorch implementation

## Import useful libraries...

```
import torch
import torch.nn as nn
import torch.optim as optim
from torch.utils.data import DataLoader, Dataset
import torch.nn.functional as F
import numpy as np
```

... and now, let's get hands on!
